

IN THE CLAIMS:

Please cancel Claims 12 to 15, 18 and 20 without prejudice or disclaimer of subject matter, and amend Claims 1, 16, 17 and 19 as shown below. The claims, as pending in the subject application, now read as follows:

1. (Currently amended) A copying ~~data processing~~ apparatus comprising:
 - an image a reader, adapted to read an image on a document and to generate data representing the image;
 - a communication unit, adapted to receive data through a network;
 - a printer, adapted to print an image based on input data;
 - a processor, adapted to perform a plurality of jobs including ~~a plurality of~~ print jobs performed by using said printer;
 - a management unit, adapted to manage information about the ~~plurality of~~ jobs performed by said processor, including (I) respective types of the print jobs which include a print of an image based on the data from said communication unit and a local copy which prints an image based on the data from said image reader equipped by said copying apparatus ~~a type of input source of data to be printed by said printer as an image, which indicates at least one of said image reader and said communication unit~~, and (ii) status information regarding each of the ~~plurality of~~ print jobs, which indicates whether each of the ~~plurality of~~ print jobs is waiting to be performed or is being performed;
 - a generating unit, adapted to generate a Web page indicating a list of the ~~plurality of~~ print jobs and the status information managed by said management unit; and

a transmitter, adapted to transmit the Web page generated by said generating unit to a Web browser.

2. (Previously presented) The apparatus according to claim 1, wherein said generating unit generates a Web page according to HTML.

3. (Previously presented) The apparatus according to claim 1, wherein said transmitter transmits a Web page according to HTTP.

4. (Previously presented) The apparatus according to claim 1, further comprising a sorting unit adapted to sort jobs performed by said processor in accordance with types of jobs, wherein said generating unit generates a Web page on the basis of sorting performed by said sorting unit.

5. (Previously presented) The apparatus according to claim 1, further comprising storage, adapted to store data processed by jobs performed by said processor, wherein said generating unit generates a Web page indicating information about the data stored in said storage.

6. (Previously presented) The apparatus according to claim 1, further comprising a receiver, adapted to receive a request from the Web browser, wherein said generating unit generates a Web page in accordance with the request received by said receiver.

7. (Canceled)

8. (Previously presented) The apparatus according to claim 6, further comprising a sender, adapted to send data stored in said storage in accordance with the request received by said receiver.

9. (Previously presented) The apparatus according to claim 6, wherein said management unit rewrites managed information in accordance with the request received by said receiver.

10. to 15. (Canceled)

16. (Currently amended) A control method for a data processing system including a copying data processing apparatus which has a Web server function and can perform a plurality of jobs including a plurality of print jobs for image data from an image a reader and a sender on a network, and a client terminal having a Web browse function, said method comprising the steps of:

causing the copying data processing apparatus to

manage information about the plurality of print jobs including (I) respective types of the print jobs which include a print of an image based on the data from said communication unit and a local copy which prints an image based on the data from said image reader equipped by said copying apparatus a type of input source of data to be printed by said printer as an image, which indicates at least one of said image reader and said communication unit, and (ii) status

information of the ~~plurality of~~ print jobs, which indicates whether each of the ~~plurality of~~ print jobs is waiting to be performed or is being performed,

generate a Web page indicating a list of the ~~plurality of~~ print jobs and the status information managed in said managing step, and

transmit the generated Web page to said client terminal; and

causing the client terminal to receive the Web page from the copying data processing apparatus,

give an instruction to the copying data processing apparatus to manipulate one of the plurality of jobs on the basis of the received Web page, and

transmit the instruction to the copying data processing apparatus,

wherein the client apparatus receives the Web page sent from the copying data processing apparatus in response to the instruction transmitted from the client terminal.

17. (Currently amended) A control method for a copying data processing, comprising the steps of:

managing information about a plurality of print jobs, performed by the data processing apparatus, including (I) respective types of the print jobs which include a print of an image based on the data from said communication unit and a local copy which prints an image based on the data from said image reader equipped by said copying apparatus ~~a type of input source of data to be printed by said printer as an image, which indicates at least one of said image reader and said communication unit,~~ and (ii) status information of the plurality of print jobs, which indicates whether each of the ~~plurality of~~ print jobs is waiting to be performed or is being performed;

generating a Web page indicating a list of the ~~plurality of~~ print jobs and the status information managed in said managing step on the basis of the managed information; and
transmitting the Web page generated in said generating step to the Web browser.

18. (Canceled)

19. (Currently Amended) A computer program product comprising a computer readable medium storing computer program code for controlling a copying data processing apparatus, said product comprising process procedure code for:

managing information about a plurality of print jobs performed by said data processing apparatus, including (I) respective types of the print jobs which include a print of an image based on the data from said communication unit and a local copy which prints an image based on the data from said image reader equipped by said copying apparatus ~~a type of input source of data to be printed by said printer as an image, which indicates at least one of said image reader and said communication unit,~~ and (ii) status information of the ~~plurality of~~ print jobs, which indicates whether each of the plurality of print jobs is waiting to be performed or is being performed;

generating a Web page indicating a list of the ~~plurality of~~ print jobs and the status information managed in said managing step on the basis of the managed information; and
transmitting the Web page generated in said generating step to the Web browser.

20. (Canceled)
